1 Introduction

The following document details the Module Interface Specifications for the implemented modules in a program simulation Solar Water Heating System with Phase Change Material. It is intended to ease navigation through the program for design and maintenance purposes. Complementary documents include the System Requirement Specifications and Module Guide.

2 Notation

The following table summarizes the primitive data types used by SWHS. SWHSalso uses some derived data types: arrays ,strings, and structures. Arrays are lists filled with elements of the same data type. Strings are arrays of characters. Structures contain pairs of keys and values, where keys are unique variable names used to identify their corresponding value, and values can be any data type. SWHSalso uses functions, which are defined by the data types of their inputs and outputs

Data Type	Notation	Description
character	char	a single symbol or digit
integer	$\mathbb Z$	a number without a fractional component in $(-\infty, \infty)$
real	\mathbb{R}	any number in $(-\infty, \infty)$

3 Module Decomposition

The following table is taken directly from the Module Guide document for this project.

11.4.2 Environment Variables

win: 2D array of pixels displayed on the screen

11.4.3 Local Variables

errorWater: real errorPCM: real

11.4.4 Assumptions

The load_params function has been called on *params*, so every variable in the structure has a value. The verify_valid function has been called on *params*, so there are no exceptions due to physically impossible values. The temperature and energy arrays have been filled by the ODE solver and energy functions, so there is no divide by zero exception.

11.4.5 Access Routine Semantics
